

#2 PHILLIPS HEAD Fine or Coarse Drywall Screws

Coarse Thread Drywall Screws

- Use coarse-thread drywall screws for most wood studs.
- Coarse-thread drywall screws work best for most applications involving drywall and wood studs. The wide threads are good at gripping into the wood and pulling the drywall against the studs.

1. Pierce the Paper:

Pierce the drywall paper with the sharp point of the screw. Place the drill-driver bit on the screw and turn on the drill.

2. Draw in the Screw:

Let the screw draw itself into the drywall and stud. Exert more force about three-quarters of the way through, otherwise the head will cam-out.

3. Stop When Flush:

Stop when the head and paper are even with each other.

4. Sink:

Apply another quarter or half-turn to the screw, to sink it just below the paper without tearing the paper.

Fine Thread Drywall Screws

- Fine-thread drywall screws are self-threading, so they work well for metal studs.
- Fine-thread drywall screws are best for installing drywall to metal studs.

- Use #2 Phillips tip.
- If not using Drywall screw gun, use our #2 Phillips Drywall Screw Setter with a stop to obtain proper depth.
